

2021-06

Style WiFi is an up-to-date and efficient solution to create a comfortable indoor climate and air exchange in refurbished premises, recently settled houses or renovated flats.

### **FUNCTIONAL**

Many units can be connected to one control network.

# **EFFICIENT**

High heat recovery efficiency of up to 90 % is achieved due to the use of a cellular regenerator.

#### **USER-FRIENDLY**

The design of the unit provides easy maintenance and installation.

of the ventilator.

Noise-insulating material provides noise absorption during the operation

# MODERN **AND SILENT**

It is enough to have only one ventilator operating in regeneration or ventilation mode to provide ventilation in the room.

The unit can be controlled via remote control and buttons on the control panel. Flexible customisation for each user via an app on the smartphone.

Trendy ventilator design.

170<sub>0</sub>

Can be mounted inside a prepared hole (from Ø170 mm) in a wall.

Connection of the units into one control network via WiFi.

Automatic drafts shutoff when the ventilator is off due to the air damper.

Ventilation of premises with the area of about 25 m<sup>2</sup> (the area is approximate and depends on the ventilation standards in your country).

2021-06

#### TWINFRESH STYLE WIFI

High efficiency - 90%. A humidity sensor. Connection of an external CO<sub>2</sub> 9 sensor or other external relay  $CO_2$ sensors. Sound pressure level from 1 to 26 dBA at a distance of 3 m. Simple mounting and maintenance.

It is advisable to use paired units to ensure balanced ventilation.

### Application example

Installation into a wall with a standard thickness using the EH-14 outer hood

Angular mounting with the NP 160 white mounting kit

Mounting into a thin wall using the EH-2 outer hood

# **RETAINS HEAT**

To preserve indoor heat, the ventilator operates in regeneration mode with two cycles, so that heat is returned to the room, the humidity balance is maintained, and the load on the heating system in winter is reduced.

Warm stale extract air is extracted from the room, simultaneously heating up and moisturising the regenerator. The filter prevents air contaminants from entering the regenerator.

In 70 seconds the ventilator switches to the supply mode automatically. Cold air enters a premise, and in 70 seconds the ventilator switches to the air exhaust mode.

Fresh but cold and dry intake air from outside flows through the regenerator, absorbs accumulated moisture and is heated due to the accumulated heat. The filter cleans the air of dust and insects.

2021-06

**CYCLE I** 

Stale air extraction.

# WHEN IT IS COLD OUTSIDE

# **SAVES ENERGY**

o ensure energy efficiency, the ventilator operates in energy acovery mode with two cycles, thereby reducing the load on the in conditioning system in summer.

# WHEN IT IS HOT OUTSIDE

11

Cool stale air is extracted from a premise, cooling the regenerator. The filter prevents air contaminants from entering the

regenerator.

In 70 seconds the ventilator switches to the supply mode automatically.

Cold air enters a premise, and in 70 seconds the ventilator switches to the air exhaust mode.

Fresh warm air from outside flows through the regenerator, and is cooled down due to the cold accumulated in the regenerator. The filter cleans the air of dust and

insects.
